Accura eQMS Kickoff Meeting

https://gemini.google.com/app/4bfd25d8f8deb9dc

User prompt: Which is I can. Yeah, so that, yeah, it's going to be busy next few weeks, but may, yeah, thanks for coming today. Maybe I thought I'll give an a rough idea on what EQMS is because I didn't know anything about EQMS before I started this. And then I'll maybe show you quickly the like initial module I've built and what I want from you guys as a help initially and then we can ticket from there. Yeah, so basically the idea is like they, eh say if you're running a lab where you are making a new medicine or you have a lab where you do like blood test or any kind of lab or manufacturing plant, there are very strict quality management regulation, like Vo, our process. So the modules are, say when you start a new lab, you go and create different documents. You create like SOP, standard working process, or whatever, different documents which people have to read. So first part is document. Someone create a document, then you, they need to have at least two level of approval. So if I'm creating a document, I'll create, I'll pick one person has the approval and every company will have a quality manager or QA. They will be the last approval. So this is like the document approval flow. And a approver is not like, okay, just click and approve and you say the button, it's approved. You need to store some kind of electronic traceable audit log to show that this person has approved it. Like they can't deny that I haven't approve. I can't say that someone use my laptop when I was having a coffee and they clicked approve. That cannot happen. So we need to ask for a password. Or if we're using Pasky, need to ask for some kind of authentication to make sure that they go and approve what they're proving or rejecting what they're rejecting, right? So document is done. I open a lab, I created some sops, everything is ready to go. Then the next thing which can happen is it's called deviation. So something which was supposed to go in one way didn't go in that way. So for example, you are creating a medicine and you have to add some chemical hundred mln. Instead of that, you only added 95 ML in a batch. So now they need to record their deviation, why it happen, and then go through the workflow of identifying what happen, what are the risk, what you need to do. So that's deviation is unplanned. Then there is a plan change, which is called change control, where you are intentionally trying to make a change. So you need to also go through the whole workflow to understand, okay, if I make this change, are there any risk? And what changes I need to make in the way the lab or the manufacture, manufacturing plant operate. So that's change control. And then Kappa is corrective and preventive action. So once you do a deviation, once you do a change control, either of them, you need to then say, okay, if I made a mistake, what corrective action I need to che take to correct this issue or what preventive action I need to share take to prevent this from happening again. That's Kappa. And then you have a training module, which is to make sure that whenever a new person join the organization or every 12 months, they go and do some kind of e learning to make sure they understand SOP or how the lab operates. So that's training module. These are the core module every company will need. And then other than that, they have things like risk management. So risk management is like you identify a risk or you think something is risk and how do you do an assessment within the organization. That's risk management. Then there's an audit management where and in you want to edit a internal or a external department and how do you prepare for that? Like, we don't need to go through all the details. Whenever I work on a module, I'll give documentation on this, those, but I'm just explaining what these modules are. So for example, I'm the QA manager and I want to audit the engineering department in a lab to make sure that they're doing everything properly, all their equipments are calibrated or not. So I will prepare an audit plan, send them a list to C, come up with the au audit checklist, and then evidence. And then I'll say that this audit is done. So that's audit module. And the last one is supply management. So if we get service or product from an outsource, like outside supplier, then we need to make sure that they follow all the procedure and then regularly audit them as well. So that's supply management. But for purpose of this initial demo, we won't focus on risk supply and audit because we don't have time to implement everything. But we'll implement the core modules. So document deviation, change

control, Kappa and training and assessment. So these are the five modules you want to focus on. Why I'm s telling you all this is like summer. If you come up with a marketing plan or something, you understand what kind of businesses we're targeting. Like this is not a SAS which everyone will use. Like January was an example of this. I, I now I realize when Q she was asking for QMS, I couldn't understand what she was talking about. I thought we already have a call like a QA in our team, but that is not a QA they can use. They need to have a process in place how we're writing code, have we consider. Everything while we're building the software, but we're focusing more on labs or more of a physical world. We're not focusing on anything to do with software. We're not focusing on software as a device or anything like that. We have focus more on laboratories, manufacturing plans, things like that. So just to give you an idea of the eight modules, we have 7,8 modules, and what kind of businesses we are focusing on. Yeah, and if, yeah, Yung, go ahead. If you have any thing you want to say. No, just want to share because what you have, share it like look like very similar to Kaiser because so I hear the terminology is so s familiar and I don't think similar but familiar for me and why Kaiser had different ISO standards. So I think that for this for Acura, so we work on different Live Science. So maybe we have the call model, but it will be a little bit apply for different live Science or industry in the Live Science. And also everything like the document control, Chi management, risk management, E is the same, but maybe that's kind of industry that work on working that way. Yep. Yes. So I want to ask you about the users because like Kaiser has 1 year failure to realize what is the user, the menu that they have to target. So at first they target both the consultants and the end user. You mean the company using that kind of services. But when we develop a complete too complicated model platform for end user, they cannot lock in Kaizo to use that because so many model and they can understand what that mean. And so Kaiser redirect to concession. So they customize the module for consultant will create all the model, and they will invite company into the platform to use. And also we can use AI because we have to like process so many document and information. So AI can input in the beginning to like filters and suggest them the change or yeah, everything. So if you want to like input AI in this in. Yeah, I don't want to. So I'll give you like, okay, so let's start with AI. Why I don't want to put AI is because in terms of change control or deviation or Kappa, this is not, you cannot, eh, like this is not a gen AI related thing. The only thing which we can generate is the document module. And my friend who is helping, like she's, you can think of her like a partner in this project. Her, she is a quality consultant, like she's the expert. So company hire her may basically to set up a new lab and she give all the template for all the documentation. So we'll have a predefined template which we will give them as part of the accurate. So if someone come and say, I want to buy license from for 10 users, we will give them all the basic documents as a template for free. They don't need to even use AI, but then they can go and tweak it depending on what they want. And in terms of like who we target, so I'll give you the my understanding and maybe we can talk a little bit more because you have experience from Kaizo side. But what is happening in Australia is that a lot of companies, they have, they're using paper based EQMs right now. Like they have some paper, some spreadsheet, something somewhere here. And then when the audit happens, they cannot put things together. So government is now trying to mandate that you need to use an eqms. Like it's not regulated yet, but this is where the regulation is moving towards that. If you're, for example, if you're creating a watch which will give you a health advice. And based on the advice, a person is taking some medicine, they need to log every single thing, every single change they're making while manufacturing that watch. So we want to build this software in terms of UI, so simple that anyone in the organization can use, but the QMS specialist will go and train these people to use eqms. They're not gonna manage it because once they go and set up the SOP and they train these people, they need to go and log everything like day to day issues in the system. So our focus from the UX perspective is still someone from a quality background, but working in this organization, they're not consultants. Like they will be the one after we go and install and validate the software, they will be the one using it every day. So in terms of the UI, like I'll show you some of the design decisions I made based on the feedback I got from Chau. But keep that in mind when we are also designing that it our workflow should look simple, but they should be restrictive that people convict mistakes. So that's

what I'm trying to follow. But again, this is more of a uiux thing. And what we're thinking is that we're gonna partner with consultant to give them some kind of revenue share to go and sell the product. So they won't be the primary user, but they still need to endorse that this software is easy enough to use and help company go and use it. I don't know how it work with Kaizo, but what I understand with eqms is they go and first a company will, even if they're setting up a new company or they're moving from paperwork to eqms, they will go and look for a quality consultant first. The consultant will then go and help them identify what system they want to implement depending on their requirements and budget and whatnot, right? So that's why we gonna give a commission if people recommend accurate, for example. Now, when they do that, the first thing the quality person do is set up, configure the whole system for this company, then add all the SOP, then do a training, and then give them a certificate that the software is pre validated, like it's ready to use. So that's where Chau will come because she is a quality consultant and she will do all that work for us. Does it make sense? Yep. Yep, that make sense. And yeah, I think guys always is also in the same situation with a lot of paperwork, documents, I mean, printing documents and front end this. And also, yes, consultant also feedback that the platform must be easier for use. So. Yeah, I don't know why they decided to go with the AI route because it's gonna be very regulated. To be honest. Like the more I work here, every time my friend ask me to do AI asset, I don't want to put it because it will become a compliant issue very soon. So the bigger market from what our initial research suggest is not Australia, to be honest, it's mainly Indian China because both Indian and Chinese government are now forcing all the labs to use EQMs and there are thousands of them and all of them are paper based. So that market is more like where you can sell it easily. But then if you use the AI model and the inference is not happening in India and China, they're not gonna use your software. So I'm not sure why Kaiso decided to do that, but I'm not gonna add any AI for now in the in this system. Think that in the beginning, maybe casual at AI because they think that AI is their unmissing point. It mean that no competitor using AI and so they want AI to like replace the boarding work, the manual work, the AI. But to be honest, when we're doing AI, you know that the result difference every time the Jane, like AI need to suggest, they have different suggestions. So I think we also have a headday for using AI for that. Yeah, so hum. Yes. Yeah, no, I I'm trying to convince my like Chau and Ravi that we don't want to use AI in this product. And if client ask, then I'm just gonna tell them that we're testing something to automatically create documents, but we'll just give them templates. I don't want to deal with that. And inference is one problem that the data should stay in Australia or in India or in China if you're using air. What? The other problem is we have no control on the token cost. So if I target a user like hundred dollars a month, and then suddenly the burning tokens, we will go bankrupt within a year. So I really don't want to know idea in that. Okay, I'll maybe quickly show. Yep. So I started with Kappa model because that's the easiest one. And I'll show the UI and then we can talk about what changes we want to build or add there, right? Give me 1 sec. So I have actually push some changes this morning where which it replace Kappa with document module. So I'll fix it by early next week. So don't look at the demo. I'm just running it locally for now and show you guys. Let me share my screen. Okay. So the way I'm thinking is that this will be based on a sub domain. So every person, every company will get their own sub domain on accurate dot 1. But by right now, I haven't implemented it. So it's similar to Slack, like if you're working in Innostar Workspace, you need to put your workspace name and then you authenticate your username and password. So by default, automatically, whatever company we're dealing with, their logo and everything will come here. But this is all coming from odd zero. So don't worry about like the first 2,3 screen. We can change them later when we reach that point. Basically, the idea is that, yeah, we, they'll be able to change the branding and the URL will also change to their own domain name. So ignore that. Now, the main one thing which I haven't done yet is dashboard and the feedback I got from the people we've spoken to is that all the existing EQMs, especially the enterprise one, are still quite information dense, but very hard to understand what's going on. So we need to come up with a dashboard once all the 8 modules are done so that and admin can see what is happening within their organization. Like a Kappa is overdue and Amit was supposed to review this document three days ago and they haven't reviewed it. Those kind of

thing. But I was thinking may once we implement all the module will have a better understanding on what we want to show on the dashboard. So right now it's just empty. There's nothing much there. Now let me go through this module like Kappa, right? So all I've done right now is just show the ID, description, status, all these kind of thing. And then right now you can just search something. I don't know if you want to extend this a bit, but say you want to create a new Kappa, you put a description and you select a type, whether it's corrective, preventive, whatever. So let's say preventive is there, is this Kappa, standalone Kappa be like you just decided to come up with the preventive action or is it related to a change control? And let's say it's a change control. So you associate that change control with your Kappa. You decide, you say which department is related to. So yeah, it's quality control. The approval is Sarah and the owner is. Yep. Oh, oh, am I still, oh, I'm still sharing the wrong screen. Let me stop and reshare. I should have told me earlier. I went through the whole. Okay, let me log out and try start again. Okay, can you see now? Yeah, so let me start again then. So idea is like you will not see this screen, but based on this sub domain, this will be automatically populated for the user and they will by default go to a login screen, which because we're using odd 0, you will be able to like you as in the organization will be able to customize it for themselves. So if it's in no style, you'll see no star logo and their branding color. So in design, don't worry about the initial 2,3 screens. That is something we can customize later for each of our organization we onboard. So sorry I made for interruptions, but why my screen saying that something went wrong and I can't see anything? i thought that only me see that。 Yes. So say I log in here, right? And this is the dashboard I was talking about that I'm just leaving it empty for now because I don't know what to show. Yep. And then Kappa. Yeah, this was the screen I was talking to. So basically, you will have a list of all the Kappa and then you right now I just have a search bar part and ability to create a new one. Yeah, now when you create the Kappa, you need to give a description, obviously, and then you need to select the type. It can be only one type. So say preventive. Now you might decide to come up with this as a standalone Kappa, like it's not related to anything happening in the organization, but it might be related to say you, you, you, there was a change control. And as part of the change control, your quality manager said that you need to take a preventive action. So you can link that change control to this Kappa. So you know, as the organization, why, why am I making this preventive action? Oh, it's part of the change control. I'm, I'm doing. So we haven't implemented the change control module, but this is also some fake data to show how things will get linked, right? And then every cap Kappa who will take this preventive action or who is responsible, you know, you pick a department, so say quality assurance, and then you come, you need to come up with who will approve that the cap is implemented correctly. So you need to pick a QA. So in, say, in this organization, there are three QAs. I pick Emily and then either I can be the owner of the cap or I can pick another owner in the organization. So I can say I like, okay, let's say John is the owner of the Kappa and I can save it in draft. It will show as a draft. Now what will happen is that Sean, who is the owner, they will go and say, yep, I have a Kappa now. They'll get a notification. Let me go and add an action. So it they will say like, I don't know, change the document or something. They will assign this work to David and then they will give a time to David that, okay, by 25th of September you need to do this. They'll submit, David will get a notification. Again, this is all front end. There's no backend at the moment. So I'm just showing or how it will work. David will get a notification that, hey, John is a assign you some work. They will also see it on their dashboard and a notification and they will click here and say, yeah, you know what, I think this is this change makes sense. I will accept it. They'll accept it. They need to sign it. They'll put their password and say, understand what I'm doing, sign done. Now, when all the action owners, I and I'll give you all the documentation, but I'll just walk you through this as well. When all the action owners have approve there, they have approve the action that they understand what the action is. Before anything happen, the QA has to go and approve as well that, okay, the, like John, who's the owner, created this Kappa, he gave the action to David, David accepted it. Now I understand that for this Kappa, I think this is the right action plan. I'll go and approve. They will sign, they'll put their take. Go next. Now, this is the thing when it's happening, action in progress, this is outside the system. We don't really do, we don't really know what they're going to do. Maybe

they're like, I don't know, replacing an equipment or doing something. But once the action is done, David will come back and say, either add a file here and say, yep, I've done my job. This is the evidence, these are my notes. This is my password. I'll go and sign it. Yeah, so all the action owners, we'll go and perform their action, put the evidence, sign. And then what will happen is that they final, now this will be in a final approval stage where again, action Kappa owner John. We'll have to go and approve and say, yep, I think David, this is Chau, his job properly, I approve. QA will go and say, yep, I think everything is done fine. I think we're ready to go sign. And now it's closed. And every time we take an action, there has, there will be an audit trail in the back end, which you can also go show and hide here to see it was in draft and then in review and approval, and then in action in progress, final approval. When things happen. This is a little bit mock data, by the way, so maybe it's not accurate, but we will show every single step when it happened, who did it in the audit trial train, and it will also be stored in S3 in a bucket where even us who have access to the AWS account cannot go and delete that audit trail. By law, we need to keep that for like. 10,20 years depending on organization's requirement. So no one can go and change it once it's generated. So these are the some of the things like the signature, these kind of thing, we need to make sure that it's not bulletproof from compliance point of view. And then one of the feedback we got from the client is like, they don't know where a Kappa is in the progress. So I open, I added this progress bar, but I was thinking maybe I can also put a name of the person who is blocking it. So for example, if it's in review, who is, who are we waiting to review or something like that, maybe we can add to help the person see what's happening. But these are all UI decisions. So I'm just telling you why I added this and you guys can decide how it should look like as far as we capture the signature and we have audit trail compliance requirements are all satisfied. So what I need from like design point of view is a consistent way of showing the audit and this progress bar, because it will be available for every module, right? Like not just for Kappa. And then how do we group these fields? How do we make it look like? Because there's so much information, we still want to show that it's group logically, not like 10 fields together. Otherwise, it might not make sense for the user or we will be too confusing for them to see what's going on. So this is like one of the modules I've done and I'm working on implementing the back end, the other module, which is right now push to production. Maybe I can show you it. Like two minutes is the document module. So the idea again is like you can either look at the existing document so you can create new. And based on the discussions I've been having, there are three scenarios, right? Someone can go and create a document from scratch. Someone can create a document if they already have a document in their system, but now they're moving to eqms. So like, for example, I have this document, it will automatically appear here in the in our system. And then the person can go and make manual changes and then submit for approval. Or the final requirement for a lot of companies is that they have documents, but they just want to use our document management also has a repository of the document. So there's no approval process, but they just want to upload it to our system. So this is something I'm just working right now. It is not finalized, but I feel like the way I've implemented it, the UI doesn't make sense. So there's all the document metadata here, then all the approval and related fields are here. And then there's a big content block here. Maybe we can break it down into three different steps. I don't know, like UX point of view, what makes sense. I leave that to you guys to guide me and help me to decide. And but the thing is, whatever we go with, we need to consistently use the same pattern on every module. I don't want like one module to have steps and the other modules have a wizard and the other modular I have some long form. We need to make sure that they look consistent so that it's easy for the user to understand what's going on. So that's about it. Like if you guys want to see all the modules, you can also look at the link I've shared before. But don't like this is just like very high level. At least when I was initially working on this. So I don't know if we might have to make some UI changes. Let me go to that screen. Yeah, so they're all the modules here, like change control deviation. But I think some of them will change because I haven't implemented them correctly. Now I understand the requirement a bit better. So I'm going and implementing the prototype one module at a time. And then I'm giving that more prototype to Chau once she up, once she approve that the fields, the status and the workflow is correct, then I

go and implement the back end. Otherwise, it's like too much WO2 and 4. That's mean in short, like, yeah, maybe next week when you have, whenever you're working on this, ping me and I can let you know if the demo URL is ready to work on. And then initial focus is just to make sure that the UI is consistent. But then like if you're working Chi on this, maybe you can become like a product designer. So think of it more high level where you can understand the requirement a bit better, not just UI, UX. You, if you understand the user, you will be able to make those decisions a bit better. Actually, after exploring the system, the link that you sent, I found that there are so many problem with the UX and also the, yeah, the UX here, actually, I did an initial analysis on the Figma. But I think that after getting more information from what you sent, like the PRD or anything like that, I can like deep down more on the analysis, but I think that I can share some of the point that I found when I explore the system. Wait a minute. Yep, sounds good. I can also try to get some screenshot of other equims. There is one which is quite popular in Australia. It's called Q Pulse, but it is very messy. Like compared to our system, it's not very easy to use. Okay, so actually when I try to log into the system, I think that as a newcomer, I think it's kind of hard to understand what the whole process, the accurate it's like it's doing. So I think the first as a designer, it could be better if we have the guide page here, which is we include all the process so that the user have the overview of what they will do and which process or which step they're in. And for the document, for the document module, eh, yeah, for the document module, I thi, I found that we also lack of some of the in important part like the quick filter that it's include some of the important things like status department. We also have here department and other needed. And when I click to view detail, and I saw that we have also the effective date, but I actually don't understand what it means and when and the detail show that the effective day is the it sets once the document is approve. But I think that thi it is the due date and on the. This is the, this is not duty. This is like, so for example, if you're coming up with a new standard operate operating procedure, then from this particular day, you will have to use the new process. So it's not the approval, like not the due date of approving the document. Like for example, you will say that from 1st of September, instead of using Lark, you have to use Google Mail. So if from effective on that day, this document is in use or in practice pretty much. But yeah, I understand your point that I think it should be in one of the columns. Yeah, I think. Yeah, I think because I saw that we also have other problem related to how we use the term like effective and related DOC document and refer document so that it cause the confusion as a newcomer. And also this field, it's place in the drop edit steps so that when I click on the create document, we also have the effective day, but as a draft version. So it change like so we cost the deviation from the official approve date. You understand what I mean? Cuz we. Yeah, but so, but before you get into detail, like one thing I want to say is like, this is all mock, right? So some of the things might not make sense. Yeah, so ignore because we tend to explain the same thing to Chau. Sometimes she say like, oh, but the due date of Kappa is before the due date of the action. I said, this is all mock data. Don't worry about it. This is all AI generated data. Like we, when we actually implement it, we will have proper, I don't know, validation in place. But yeah, it's good that you're doing that level of analysis. I, yeah, because I'm okay. Okay, okay. Yeah. Oh, yeah, is it try to understand about the, how the back end of the logic will link together so that I just feel so hard to understand the effective day here. So I just wanna raise with you and. So the other thing I want to mention is like some of these things might be confusing for us, like effective date or reference data, but the people who will use this system are quality experts. So for them, this is a day to day language they use. So we cannot change the terminology, but we can make the UI easy enough for them to understand the workflow. If that. Yeah, yeah, yeah, that's right. Okay, in the Create new Documents screen, we have the three cards here. But, and the problem is that I think like how can we verify the already approve documents? Are there any difference between the platform handling document and the other document? I mean, because it's all the document requires the like the leaks of things we need to complete to make it approve document. So I just wonder, and the second one is from the UIUX and the card one is the clickable area to open the page. Why the other using the button? So it's not consistent in terms of the C, you, how we use the CTA. Yeah. Yeah, no, thi. That's why I said like, this is a new model. I just push. So this is not ready for your

review. Like you can look at Kappa, but to give you an answer, yeah, this is not consistent. And this is something I just raise today with Chau as well. So they obviously we, when we implement, we need to build in a way where all the blocks, e, all the cards are clickable if we go with that option, right? In terms of when you say already approve document, the this is what people do is if they have never use eqms, but they already have approve documents and Sharepoint or their local directory when they get the eqms, they just want to upload those document without going through the review process. So maybe what we can do is only allow them to upload PDF because PDF is read only. But again, that's something we'll have to discuss with the clients and come up with a requirement. But yeah, UI wise, it's not consistent. And I don't want to put like, I've put 3 full line of to explain, but the explanation is more for Chau to understand what these three buttons are. These are not the final UI for the end user. So I would say start with Kappa because Kappa is like the simplest of this workflow. And then we go one by one to other module. Don't look at document. This is like very confusing. And even I have no clear requirements about what we need to do. Like I just got a new requirement from Chau that every time you create a document, once you convert into PDF is read only that the document is already approved. They go and add a custom header and a footer to say it's approve with approval name and all those kind of thing. So I'm still not really sure about those requirements. So don't look at document model. Start with Kappa. I think that will be the best to work with. I just. Yeah, I'm just showing the initial analysis of like, show you how I do the exploration, like the UX enhancement so that you can, I would, yeah, but I actually I'm trying to understand how the platform work. So yeah, it's all. It's okay. You can send me the document later. Okay, that's all from my side. Yeah, but ma, like I want to make sure that you don't like waste your time on something which I know it's not working, you know, otherwise you will think that this is the final version and you will do all your analysis where this is all like throw away. Yeah, yeah. Sounds good. I, by the way, do you like the way I present? Can I, if we do another module, can I still like continue using this presentation for you guys to understand the US and UI enhancement? Yeah, use whatever make so sense for you. This is like your domain. So whatever tool is easy for you, use those two. Really, it's this is not. No, I think it's all good. Whatever you feel comfortable with and whatever you feel will be quicker for you to use it. And we, because we don't have any team, so we can decide what tool to use. It's okay. And maybe what I will do. So my this is my workflow, right for your all your key, like everyone to understand. I'll pick one module, come up with all the status and workflow, give it to Chau, for Chau to say, yeah, this makes sense. Then I will give that workflow to Chi, to you to for you to say, okay, you've done your job, but the UI scrap, let me go and fix it. Then you can give me the final version of the UI. Yeah, just make sure that I. While I'll go and implement the backend. And every module, I will also give you an MD file of regulatory requirement, business requirement, functional and non functional requirement. And the idea is that you, you have, you will have a clear understanding on what is the requirement from the regulatory perspective. Like for example, you can say doesn't make sense. Why are we asking for password again and again? It's not a user, a good user experience, but it's a mandatory requirement from business side. So at least you will have a clear understanding on why we're building something like this. So I'll share it, share the Kappa one for you, for you, you can review it. And then next module we work. okay, got it。 I'll share the next module. Yeah, but one thing I have, I'll tell you that, because I want to get at least not a perfect version, but a version where when we do things, things get stored into backend ready by like before 14th of September. I will move very fast. So my aim is like 2 day per module and 5 module I want to finish in 10 days. So don't spend too much time on over analyzing. Like maybe first goal we do is just to make sure the UI is consistent. And then you can go in depth and think about like validation errors and I don't know what not. Because otherwise it will be very overwhelming for you that these guys like Con continuously pushing work to me, but I have a deadline that I need to finish everything. If you have to demo 14th, I want to finish everything by like 9th or 10th. And then we can do some practice on how, what we gonna demo to the client. OK。 Yeah, so don't like E, even if you're happy with it to present, it's okay. Like, and then Kim, you can make like a backlog for yourself to say, I don't like how we create document.

Maybe with that page, I need to review, revisit, and then we can come back and fix it. And my main problem is I can use AI to write all the backend code as well because I want to make sure that it's all compliant. So that's why I need to move a bit faster UI, I will use AI back end. I will use AI assisted. I need to make sure I review each and every line to, yeah, there's no leak or anything from data side. Sounds good. Okay. OK。 okay sounds great。 And then maybe when once summer you have time, I think we can think of like marketing side, what do you want to do? We maybe starting point can be like a 1 or 2 pager brochure for what we can share from with potential clients. I think your slides are really good. So we're just use we use that for two presentations already and might do another one very soon. We just tweaking whatever you've given and just changing company names there. So, but I think I, yep, let me see. Like there are few, what are the other things the guys ask me to do? Yeah, I think brochure is the main thing, but not urgent, like maybe 2,3 weeks whenever you have time, not something urgent. But next thing. And then if you can do, give me a Semrush report, I'll give you 3 EQMs. If you can give me some keywords and some idea on what block goes to, right, I can start doing that. And my plan is to go. And so some company already sent me an email that they added Acura in their list of eqms. They're like a Saas directory. I don't know where they found it, found us from. So I'm thinking for backlinking, I will go and find all the companies where they list EQMs and then go and add them. Maybe someone I'll share that list with you. You can give me some feedback on what I should add there. Like, I don't know, logo on X. So I can do that. Yeah. hum。 okay so let me okay。 Okay. Okay. Yeah, okay, okay. Yeah, so I win. Next step, I win, like send you some similar response on the keyword that you can pay on that to create a blog post and then the push word. Yeah, okay, got it. I think, yeah, that so that anything else you can think, because I don't think this is a product where we need to focus too much on marketing on social media. I might do something on LinkedIn later, but there's not much, like no one will go to Facebook to search for an eqms. So I don't like this. Something need to do. So yeah, and I will create still I create all the social media pages somewhere and I'll give you access to that. Like you don't need to use them, but just to make sure that we have like, I've already created Insta page, but I'll create further as well and I'll give you access, like a admin access so you can do whatever. And. Yeah, yeah, of course. Yeah. Okay. Okay. We should have some social media channel. Like we don't need to update like regularly, but we should have one to have the digital present on the internet. Yeah, yeah, I think for like, definitely we will need LinkedIn because I don't know, people are already searching for EQMs in Australia and finding us. So there must be something there. But I don't know where this is coming from. So we can maybe put more focus on LinkedIn and other channel. I'll make you admit commerce. So you can decide. And this is our own product, so we don't need to check with anybody. We just do whatever. So if you think it makes sense, then just do it. Alright, and maybe, Yung, like maybe next week when you back from the holiday, I'm just trying to understand if like I'm missing something in terms of the product strategy because you have more experience working with Kaizo. So I don't want to go blind and over confident that, oh, we're doing something amazing and then realize there's no market for this. So let's catch up when you're back just so that we don't miss something. Okay, cool. Alright, thanks guys. Have a good break. Whoever is taking a break or otherwise, I'll see you online, right? Yeah, yeah. Okay, got it. Hey, okay. Okay, got it. Okay, thank you. Thanks. Bye. Okay. I. Eh, see you. Bye bye. Đây là meeting transcript từ Accura Kickoff. Vì không thể xuất file transcript trực tiếp từ meeting nên sẽ hơi khó để nhận biết ai đang nói, nhưng mặt bằng chung chắc bạn có thể nói lại các ý chính, các cuộc trao đổi, mong muốn của khách hàng, mong muốn của client đối với designer làm những gì, client có request gì, có complain gì, next step là gì, summarize lại toàn bộ giúp tôi

Response: Cuộc họp Kickoff dự án **Accura** tập trung vào việc định hình nền tảng eQMS (Electronic Quality Management System), làm rõ luồng nghiệp vụ CAPA/Document, thống nhất nguyên tắc thiết kế giao diện và chốt kế hoạch chạy nước rút cho bản Demo ngày 14/09.

1. Định vị sản phẩm & Chiến lược kinh doanh

- **Đối tượng khách hàng:** Tập trung vào các phòng thí nghiệm (Laboratories) và nhà máy sản xuất (Manufacturing plants) trong thế giới vật lý thuộc ngành Life Sciences (dược phẩm, xét nghiệm, y sinh). Không nhắm đến mảng phần mềm y tế (SaMD) hay SaaS đại trà.
- **Thị trường trọng điểm:**
    - *Australia:* Các doanh nghiệp đang chuyển dịch từ hệ thống giấy/Excel sang eQMS do định hướng siết chặt quản lý từ chính phủ.
    - *Ấn Độ & Trung Quốc:* Thị trường khổng lồ với hàng nghìn phòng lab đang bị chính phủ bắt buộc chuyển đổi từ giấy sang eQMS.
- **Mô hình Go-To-Market (GTM):** Hợp tác với các chuyên gia tư vấn chất lượng (Quality Consultants) thông qua cơ chế chia sẻ doanh thu/hoa hồng. Chuyên gia (như Chau) sẽ tư vấn, cấu hình hệ thống, cung cấp bộ tài liệu SOP mẫu có sẵn (Pre-validated templates), đào tạo nhân sự và cấp chứng chỉ thẩm định.
- **Quyết định dứt khoát về AI:** Không tích hợp Generative AI vào các luồng cốt lõi (CAPA, Change Control, Deviation) vì rủi ro sai lệch dữ liệu tuân thủ, quy định khắt khe về vị trí lưu trữ dữ liệu (Data Residency tại Úc/Ấn Độ/Trung Quốc) và bài toán chi phí token.

2. Phạm vi tính năng & Nghiệp vụ hệ thống

- **5 Phân hệ cốt lõi tập trung làm trước cho bản Demo:**
    1. *Document Control:* Tạo lập, kiểm soát phiên bản và phê duyệt tài liệu/SOP.
    2. *Deviations:* Ghi nhận sai lệch ngoài kế hoạch trong quá trình vận hành/sản xuất.
    3. *Change Control:* Quản lý các thay đổi có chủ đích và đánh giá rủi ro đi kèm.
    4. *CAPA (Corrective and Preventive Action):* Xử lý nguyên nhân gốc rễ và lập hành động khắc phục/phòng ngừa.
    5. *Training & Assessment:* Đào tạo định kỳ và tự động hóa theo dõi năng lực theo SOP.
- *3 Phân hệ tạm hoãn (làm sau Demo):* Risk Management, Audit Management, Supplier Quality.
- **Chi tiết luồng nghiệp vụ CAPA (Module chuẩn mực để thiết kế):**
    - *Khởi tạo:* Chọn loại (Corrective / Preventive), liên kết với nguồn phát sinh (Deviation hoặc Change Control), gán phòng ban, QA Approver và CAPA Owner.
    - *Phân công hành động (Action Plan):* Owner giao việc cho người thực hiện (Action Owner) kèm hạn hoàn thành (Due Date).
    - *Xác nhận & Ký số (Electronic Signature):* Người thực hiện kiểm tra và ký xác nhận; QA duyệt kế hoạch hành động. Mọi hành động duyệt/ký đều bắt buộc nhập lại mật khẩu/Passkey để xác thực danh tính chống chối bỏ (Non-repudiation) theo chuẩn FDA 21 CFR Part 11.
    - *Thực thi & Nghiệm thu:* Người thực hiện tải bằng chứng (Evidence), ghi chú và ký đóng việc; Owner và QA thực hiện phê duyệt cuối cùng (Final Approval) để đóng CAPA.

- *Audit Trail (Vết kiểm toán):* Tự động ghi lại từng bước (Ai làm, làm gì, lúc nào) và lưu trữ bất biến (WORM) trên AWS S3 trong 10–20 năm, không ai có thể can thiệp hay xóa.

3. Trao đổi & Phản hồi thực tế giữa Designer (Chi) và Client (Amit)

- **Góp ý từ Designer (Chi):**
  - Người dùng mới khó nắm bắt luồng tổng thể nếu thiếu trang hướng dẫn (Guide/Onboarding page).
  - Thiếu các bộ lọc nhanh (Quick filters) theo Trạng thái (Status), Phòng ban (Department).
  - Thuật ngữ *"Effective Date"* gây bối rối, dễ nhầm với Due Date khi hiển thị ở bước tạo bản nháp.
  - Trang tạo Document hiển thị 3 Card chức năng không đồng nhất về tương tác (Card 1 click vào cả khung, 2 Card còn lại dùng nút bấm CTA).
- **Giải thích và điều chỉnh từ Client (Amit):**
  - *Về thuật ngữ:* "Effective Date" là thuật ngữ tiêu chuẩn bắt buộc trong ngành Quality/Pharma (ngày SOP chính thức có hiệu lực áp dụng thực tế, khác với ngày duyệt), người làm QA chuyên môn sẽ hiểu rõ nên không được đổi tên.
  - *Về dữ liệu & lỗi logic:* Hiện tại bản prototype chứa nhiều Mock Data do AI sinh ra (như ngày đến hạn bị lệch), Designer không cần tốn thời gian phân tích sâu vào số liệu giả.
  - *Về module Document:* Chưa hoàn thiện nghiệp vụ và giao diện hiện tại rất thô (vừa nhận thêm yêu cầu xuất PDF kèm Header/Footer tự động), Designer nên tạm bỏ qua và tập trung hoàn toàn vào CAPA trước.

4. Yêu cầu & Mong muốn của Client đối với Designer (Chi)

- **Tập trung vào CAPA đầu tiên:** Lấy CAPA làm chuẩn mực UI/UX để hoàn thiện trước vì luồng logic của module này đã rõ ràng nhất.
- **Xây dựng tính nhất quán cho Design System:**
  - Thanh tiến trình (Progress Bar) trực quan: Hiển thị rõ ràng trạng thái hiện tại và chỉ đích danh người đang giữ quyền duyệt (Ai đang chặn tiến độ).
  - Trải nghiệm Ký số (Signature Modal): Quy chuẩn hóa việc yêu cầu xác thực mật khẩu.
  - Khung hiển thị Audit Trail: Thiết kế gọn gàng, có thể ẩn/hiện linh hoạt.
  - Bố cục form thông tin: Nhóm các trường dữ liệu (Grouping) một cách khoa học, tránh nhồi nhét quá nhiều trường gây rối mắt.
  - Đồng bộ pattern tương tác cho toàn bộ các module về sau (không để module dùng wizard, module dùng form dài).
- **Nâng tầm vai trò (Product Designer):** Nắm bắt sâu các yêu cầu nghiệp vụ và quy định pháp lý (Regulatory Requirements) từ tài liệu Markdown (`.md`) mà Amit cung cấp cho từng

module, thay vì chỉ vẽ lại giao diện bề mặt.

- **Tốc độ ưu tiên hơn sự hoàn hảo:**
    - Không sa đà vào over-analyzing các trường hợp biên (edge cases) hay thông báo lỗi chi tiết ở giai đoạn này.
    - Tập trung chốt layout và luồng giao diện nhất quán để kịp tiến độ kỹ thuật.

5. Phân công các mảng liên quan

- **Marketing (Summer):**
    - Soạn thảo Brochure giới thiệu giải pháp (1–2 trang) cho tệp khách hàng B2B.
    - Xuất báo cáo từ khóa Semrush từ 3 đối thủ eQMS để lên kế hoạch viết bài SEO/Blog.
    - Tìm kiếm và submit profile Accura lên các trang danh bạ SaaS uy tín để xây dựng backlink.
    - Thiết lập kênh truyền thông số, ưu tiên tập trung nội dung chuyên nghiệp trên LinkedIn.
- **Chiến lược sản phẩm (Yung & Amit):**
    - Họp riêng sau kỳ nghỉ để trao đổi sâu hơn về kinh nghiệm từ dự án Kaizo (tránh sai lầm trong việc định vị tệp người dùng và tránh phức tạp hóa sản phẩm).

6. Kế hoạch hành động & Mốc thời gian (Next Steps)

- **Tiến độ Backend (Amit):** Chạy nước rút 2 ngày/module, hoàn thành xong 5 module cốt lõi trong vòng 10 ngày.
- **Quy trình phối hợp từng tính năng:**
    1. Amit phác thảo Workflow và Trạng thái → Gửi Chau duyệt chuẩn nghiệp vụ QA.
    2. Amit gửi tài liệu `.md` (Functional & Regulatory specs) → Chi thiết kế và chuẩn hóa UI/UX trên Figma.
    3. Chi bàn giao UI hoàn chỉnh → Amit lập trình Backend và nối API.
- **Deadlines:**
    - *09/09 – 10/09:* Toàn bộ hệ thống 5 module cốt lõi kết nối xong Backend, sẵn sàng dữ liệu thực tế để chạy thử nội bộ.
    - *14/09:* Buổi Demo chính thức với khách hàng.

User prompt: Xây dựng tính nhất quán cho Design System: -> phần này client nói ở câu nào á

Response: Ý **"Xây dựng tính nhất quán cho Design System"** được Client (Amit) nói ở 3 đoạn chính trong transcript cuộc họp:

1. Về quy chuẩn chung cho toàn bộ các module (Pattern, Wizard vs Form) Client nhấn mạnh việc không để mỗi module dùng một kiểu layout khác nhau:

> *"And but the thing is, whatever we go with, we need to **consistently use the same pattern on every module**. I don't want like one module to have steps and the other modules have a wizard and the other modular I have some long form. We need to make sure that they look consistent so that it's easy for the user to understand what's going on."*

2. Về Progress Bar, Audit Log và cách gom nhóm Form fields Client yêu cầu Designer tìm cách hiển thị đồng bộ thanh tiến trình, vết kiểm toán và bố cục thông tin:

> *"So what I need from like design point of view is **a consistent way of showing the audit and this progress bar, because it will be available for every module**, right? Like not just for Kappa. And then **how do we group these fields?** How do we make it look like? Because there's so much information, we still want to show that it's group logically, not like 10 fields together. Otherwise, it might not make sense for the user or we will be too confusing for them to see what's going on."*

3. Về trạng thái người chặn tiến độ và tính tuân thủ của Chữ ký / Audit Trail Client gợi ý đưa tên người đang giữ task vào progress bar và chốt yêu cầu tuân thủ:

> *"So I added this progress bar, but I was thinking **maybe I can also put a name of the person who is blocking it**. So for example, if it's in review, who are we waiting to review or something like that... you guys can decide how it should look like **as far as we capture the signature and we have audit trail compliance requirements** are all satisfied."*

4. Về việc ưu tiên hoàn thiện tính nhất quán UI trước Client nhắc nhở không sa đà vào lỗi logic nhỏ mà ưu tiên đồng bộ giao diện trước ngày 14/09:

> *"Like maybe first goal we do is **just to make sure the UI is consistent**. And then you can go in depth and think about like validation errors and I don't know what not."*

User prompt: theo bạn thì next step trong tuần tới designer sẽ phải làm những gì, và cần requirement gì từ Amit? đây là buổi keckoff bắt đầu từ thứ 6 tuần trước.

Response: Dựa trên buổi kickoff và mốc thời gian gấp rút (**Demo ngày 14/09, hệ thống phải xong backend trước 09-10/09**), dưới đây là chi tiết công việc cụ thể của Designer và danh sách requirement cần chốt từ Amit cho tuần tới.

1. Next Steps cụ thể cho Designer trong tuần tới

- **Tập trung tối đa vào Module CAPA (Bỏ qua Document Control):**
    - Lấy CAPA làm màn hình chuẩn (Master Template) để định hình toàn bộ luồng giao diện cho các module sau.

    - Tạm dừng phân tích/thiết kế module Document vì Amit và Chau chưa chốt xong logic xuất PDF và template.

- **Thiết kế & Chuẩn hóa 4 Pattern dùng chung (Design System Components):**
    - *Progress Bar (Thanh tiến trình trạng thái):* Thiết kế rõ các giai đoạn (`Draft` → `In Review` → `Action in Progress` → `Closed`) kèm nhãn hiển thị ai đang chặn tiến độ (ví dụ: *"Pending QA Review by Emily"*).
    - *Electronic Signature Modal (Hộp thoại Ký số):* Chuẩn hóa popup nhập password/passkey xác thực danh tính kèm nội dung cam kết tuân thủ.
    - *Audit Trail Panel (Nhật ký kiểm toán):* Thiết kế khung hiển thị lịch sử thay đổi (Ai - Làm gì - Thời gian nào) dạng drawer hoặc card có thể đóng/mở (Show/Hide) linh hoạt.
    - *Form Layout & Grouping (Bố cục nhập liệu):* Gom nhóm hợp lý các trường thông tin (Thông tin chung, Nguồn phát sinh Deviation/Change Control, Người phụ trách, Kế hoạch hành động) thay vì dàn trải 10+ trường trên một trang.
- **Thiết kế màn hình Danh sách (List view & Data Table):**
    - Quy chuẩn bảng dữ liệu: Bộ lọc nhanh (Status, Department), thanh tìm kiếm, và status badge đồng nhất.
- **Tối ưu tốc độ giao diện (Fast iteration):**
    - Thiết kế giao diện ở mức hoàn thiện khung logic và tính nhất quán (Consistent UI), không sa đà vào over-analyzing các trường hợp biên (edge cases) hay thiết kế màn hình lỗi chi tiết lúc này để Amit kịp ráp Backend.

2. Requirements & Tài liệu cần Amit cung cấp ngay

STT	Tài liệu / Yêu cầu cần từ Amit	Mục đích sử dụng cho Design
1	**File Markdown (`.md`) về CAPA specs**	Nắm rõ Business, Functional, Non-functional và Regulatory Requirements (lý do tại sao phải có một số bước bắt buộc).
2	**Workflow & Trường dữ liệu đã chốt với Chau**	Đảm bảo danh sách trường thông tin (Field list), các vai trò (Owner, QA, Action Owner) là dữ liệu thật từ chuyên gia QA, không phải mock data ngẫu nhiên.
3	**Demo URL cập nhật**	Để Designer test trực tiếp luồng thao tác thực tế sau khi Amit fix lại code frontend vào đầu tuần.
4	**Quy chuẩn Branding/Sub-domain**	Xác định vị trí và cách hiển thị dynamic logo/màu sắc của từng doanh nghiệp khách hàng (Tenant branding) trên giao diện.

3. Lưu ý quan trọng về Mindset & Cách phối hợp

- **Không tự ý đổi thuật ngữ chuyên ngành:** Các từ như *Effective Date*, *Deviation*, *CAPA*, *Reference Document* là thuật ngữ chuẩn mực của ngành QA/Life Sciences. Nhiệm vụ của UI là làm luồng đi rõ ràng, không thay thế từ ngữ.
- **Tiến độ 2 ngày / module:** Khi Amit gửi workflow module nào (Change Control, Deviation...), Designer chỉ cần áp dụng đúng các Pattern đã chuẩn hóa từ CAPA sang để bàn giao UI trong 1–2 ngày cho Amit code Backend.

User prompt: Trong nội dung kickoff, mọi người có đề cập về đối thủ của Accura hoặc possible competitor that accura might face không

Response: Trong buổi kickoff, mọi người **có đề cập trực tiếp và gián tiếp** đến các đối thủ cũng như các giải pháp thay thế mà Accura đang và sẽ phải đối mặt:

1. Q-Pulse (Đối thủ trực tiếp được nhắc đích danh tại thị trường Úc)

- Amit trực tiếp nêu tên: Đây là hệ thống eQMS hiện khá phổ biến tại Australia.
- Đánh giá từ Amit: Giao diện và trải nghiệm của Q-Pulse rất lộn xộn, rối rắm (*"very messy, not very easy to use"*), khó dùng hơn nhiều so với định hướng tinh gọn mà Accura đang hướng tới.

2. Kaizo (Nền tảng tương đồng được đem ra làm case study so sánh)

- Yung và Amit thảo luận rất kỹ về Kaizo (nền tảng áp dụng các tiêu chuẩn ISO tương tự mà Yung từng có kinh nghiệm làm việc).
- Các vấn đề đối thủ Kaizo từng vấp phải:
    - Từng mất 1 năm loay hoay thất bại khi cố gắng nhắm thẳng vào end-user nhưng xây dựng nền tảng quá phức tạp khiến người dùng không thể tự dùng được, sau đó phải đổi hướng sang bán qua kênh đơn vị tư vấn (Consultants).
    - Kaizo cố gắng dùng AI để tạo sự khác biệt trên thị trường (*"unmissing point / no competitor using AI"*), nhưng thực tế AI đưa ra kết quả thiếu nhất quán và gây rủi ro lớn về tuân thủ.

3. Nhóm Enterprise eQMS truyền thống (Hệ thống doanh nghiệp lớn)

- Amit nhận xét chung về các eQMS dạng Enterprise hiện nay: Rất dày đặc thông tin (*"information dense"*), nhưng lại cực kỳ khó để người quản trị hoặc người dùng hiểu được chuyện gì đang thực sự diễn ra (ví dụ: CAPA nào đang bị trễ, ai đang là người chặn tiến độ).
- Đây là lý do Accura muốn tạo sự khác biệt bằng cách làm thanh tiến trình (Progress Bar), hiển thị rõ người đang giữ task và thiết kế Dashboard trực quan hơn.

4. Hồ sơ giấy & Bảng tính Excel thủ công (Đối thủ gián tiếp lớn nhất)

- Cả Amit và Yung đều xác định đối thủ thực tế lớn nhất cần thay thế hiện nay là **Paper-based eQMS / Spreadsheets**:

- Đa số các phòng thí nghiệm, cơ sở sản xuất tại Úc, Ấn Độ và Trung Quốc vẫn đang chạy quy trình chất lượng bằng giấy in, chữ ký tay và các file Excel rời rạc trên SharePoint hoặc máy tính cá nhân.
- Khi cơ quan quản lý vào kiểm toán (audit), các đơn vị này không thể liên kết hay tìm lại dữ liệu kịp thời.

5. 3 đối thủ eQMS ẩn danh (Được đưa vào kế hoạch nghiên cứu SEO)

- Ở phần phân công marketing cho Summer, Amit có nhắc đến việc anh sẽ gửi danh sách **3 hệ thống eQMS đối thủ** để Summer chạy báo cáo Semrush, bóc tách từ khóa (keywords) và xem cấu trúc bài blog/content của họ nhằm lên chiến lược cạnh tranh từ khóa cho Accura.

User prompt: theo kickopff thì Amit mong muốn điều chỉnh gì từ phần E signature

Response: Trong buổi Kickoff, Amit đã giải thích rất rõ lý do tại sao E-signature lại được xây dựng như vậy và đưa ra các mong muốn cụ thể đối với phần này:

1. Bắt buộc tái xác thực danh tính (Không chấp nhận One-Click Approve)

- **Nguyên tắc chống chối bỏ (Non-repudiation):** Amit nhấn mạnh không thể làm kiểu chỉ click một nút "Approve" là xong. Hệ thống phải có cơ chế ngăn chặn việc người khác lợi dụng tài khoản (ví dụ: ai đó bấm duyệt hộ khi chủ tài khoản rời bàn đi uống cà phê).
- **Yêu cầu kỹ thuật:** Bắt buộc phải bật popup yêu cầu người dùng **nhập lại mật khẩu (Password)** hoặc xác thực qua **Passkey** mỗi khi thực hiện phê duyệt (Approve) hoặc từ chối (Reject).

2. Bắt buộc có tuyên bố nhận thức hành vi (Intent & Legal Meaning)

- Khi ký, người dùng không chỉ gõ mật khẩu mà phải xác nhận nội dung cam kết pháp lý (trong bản demo Amit nói câu: *"understand what I'm doing, sign done"*) để gắn chặt trách nhiệm của người ký với quyết định phê duyệt.

3. Áp dụng E-signature xuyên suốt mọi cổng kiểm soát của luồng CAPA Amit demo việc ký số phải xuất hiện ở tất cả các bước chuyển trạng thái quan trọng:

- *Action Owner:* Nhập mật khẩu để ký chấp nhận công việc (Accept Action).
- *QA Approver:* Ký duyệt kế hoạch hành động tổng thể trước khi cho phép triển khai.
- *Action Owner:* Tải bằng chứng (Evidence), viết ghi chú và nhập mật khẩu để ký nộp.
- *CAPA Owner & QA:* Cả hai cùng ký xác thực ở bước nghiệm thu cuối cùng (Final Approval) để chính thức đóng hồ sơ.

4. Lưu ý đặc biệt cho Designer về xung đột giữa "UX mượt mà" và "Quy định pháp lý"

- Amit lưu ý trước cho Chi (Designer): Đứng từ góc độ UX thông thường, Designer có thể thắc mắc *"Tại sao bước nào cũng bắt người dùng nhập lại mật khẩu, trải nghiệm như vậy rất phiền toái?"*.

- Tuy nhiên, Amit khẳng định đây là **yêu cầu bắt buộc từ phía cơ quan quản lý (Regulatory requirement)** trong ngành Dược/Life Sciences (chuẩn 21 CFR Part 11). Thiết kế không được tìm cách lược bỏ hay tinh giản bước nhập mật khẩu này, mà nhiệm vụ của UX là làm cho modal xác thực này trực quan, rõ ràng và dễ thao tác nhất.

5. Chuẩn hóa thành một Master Component dùng chung

- Hiện tại trên bản demo của Amit, tính năng ký số chỉ là mock data (nhập mật khẩu bất kỳ cũng cho qua, chưa kiểm tra quyền thực tế).
- Amit mong muốn Designer chuẩn hóa giao diện **E-signature Modal** thành một pattern nhất quán để tái sử dụng xuyên suốt cho cả 5 phân hệ (CAPA, Document, Deviation, Change Control, Training), đồng thời đảm bảo mọi dữ liệu ký được lưu vết chặt chẽ vào hệ thống Audit Trail bất biến.
